

As part of our screening process we ask candidates to write a simple program in php.

If you are interested in Marketo's LAMP developer position, please send me a link to a svn/git repo or a tar containing the php code performing the tasks described below:

Program task:

- fetches an object in JSON format from an endpoint given as an argument
- stores the object in a mysql db (mysql:host=localhost;dbname=testdb;, user: user, password: passwd)

Working assumptions :

- in production, the script will be run of crond on a minute frequency
- object JSON format: {"name":"","id":0,"value":"","timestamp":""}, where id and name are unique.
